

ABSTRACT

[0059] An anti-theft device for a motorcycle having an associated remote control, prevents accidental misplacement or accidental confinement of the remote control in a locked storage box on the motorcycle. The anti-theft device includes a main switch and a remote control holder integrated with a handlebar locking module. When an unlocking signal is transmitted from the remote control, the locking of a handlebar may be released by a handlebar locking actuator only when the remote control is inserted into the remote control holder, thereby actuating a main relay driving circuit so that power is supplied to electric equipment and the motorcycle's engine can be started.
